Where did time go in 2015?

Time Use Statistics Derived from the Statistics Canada General Social Survey

May 27, 2019

BACKGROUND

In litigation pertaining to personal injury or wrongful death, the annual cost of lost valuable services is ideally determined based on the actual time that the injured or deceased individual expended on household tasks. Population averages, however, are typically used if it is difficult or impractical to estimate the time previously spent on certain tasks.

For this purpose, actuaries have generally used survey data from one of two sources in recent years:

1. *Where does time go?* – This 1991 document was published by the Housing, Family and Social Statistics Division of Statistics Canada as part of its General Social Survey Analysis Series. Although the study was released more than 25 years ago, the analysis remained useful because it includes a breakdown of the average time spent by individuals on Domestic Work, Primary Child Care, and Support and Services based on demographic characteristics such as:

- Male or female
- Employed, not employed, or retired
- Lives with or without a partner, with parents, alone, or with non-family individuals
- Lives with children over the age of 5 years, under the age of 5 years, or without children

One shortcoming of the 1991 publication is that there is no breakdown by age.

2. *2010 Overview of the Time Use of Canadians* – Although more recent, the data in this Statistics Canada publication is based on all females and males (combined) in given age groupings including those who are employed, unemployed, and retired, regardless of

McKeating Actuarial Services, Inc.

www.mckeating-actuarial.com

home and family circumstances. For that reason, the 2010 data was not necessarily a helpful benchmark for estimating the lost valuable services of a specific individual.

Data from the 2015 General Social Survey – available from Statistics Canada as a Public Use Microdata File – does include a considerable amount of additional granularity. Using this data file, we have generated time use tables broken down by the demographic and other characteristics of the 1991 publication, as well as by age group. We hope that actuaries and other economic loss experts will find these tables useful.

THE 2015 GENERAL SOCIAL SURVEY

The 2015 General Social Survey conducted by Statistics Canada focused on time use. This survey of Canadians age 15 and over in all 10 provinces was conducted by telephone, first identifying households. For each household, a roster was created. Then a respondent was selected from the roster.

Respondents were asked questions for classification purposes, for example, age (birth date), sex, and marital status, as well as the main activity of the respondent during the past 12 months and during the last week. The main activity information allows one to determine whether the respondent is employed, retired, a student, etc.

Respondents were also asked questions related to their use of time, including questions about specific activities performed during a 24-hour period. These activities include both paid and unpaid work activities (such as housework, yard work or household maintenance, caring for children or providing assistance to seniors). The resulting information allows one to calculate the average time per day spent on various activities.

The data file contains information from 17,390 respondents. Associated with each individual is a “person weight.” The sum of the person weights is 29,766,399 (the total age 15 and over population of Canada in 2015). The person weights for a particular subgroup of respondents, say males age 35 to 44, can be used to estimate average times spent on various activities by that subgroup of the population. Such estimates are simply weighted averages, determined as follows:

$$\begin{aligned} & \text{Estimated average time spent on activity } A \text{ by Canadians in subgroup } S \\ &= \frac{\sum_{i \in S} (\text{time spent on activity } A \text{ by person } i) \times (\text{person weight for person } i)}{\sum_{i \in S} (\text{person weight for person } i)} \end{aligned}$$

McKeating Actuarial Services, Inc.

www.mckeating-actuarial.com

The data file also provides 500 sets of “bootstrap weights” to enable one to estimate standard deviations that quantify sampling variability. Each set of bootstrap weights is used in place of the person weights to re-calculate the average time spent on an activity by those in a given subgroup. The resulting 500 averages are interpreted as averages that result from redoing the survey 500 times, where different survey participants are randomly selected each time. One can then quantify the sampling variability using the standard deviation of the 500 averages.

ACTIVITY CATEGORIES

The data file includes a number of “duration variables” providing the time in minutes spent on various activities in a given day for each respondent. We converted these times to hours and calculated totals for different categories. Where possible, our categories are consistent with past Statistics Canada publications on time use. Specifically, we categorized activities as follows:

1. Time spent on **domestic work** equals the sum of the times spent on

- meal preparation
- preserving foods
- indoor house cleaning
- garbage, recycling, unpacking goods
- laundry, ironing, sewing, shoe care
- repair, painting, renovation
- organizing, planning, paying bills
- packing/unpacking – groceries, luggage, boxes
- outdoor maintenance
- planting/maintaining garden or house plants
- pet care;

2. Time spent on **child care** equals the sum of the times spent on

- care of household child (<15) – personal care
- care of household child (<15) – accompanying
- care of household child (15-17) – personal care
- care of household child (15-17) – accompanying;

3. Time spent on **other care** equals the sum of the times spent on

- care of household adult – personal care
- care of household adult – accompanying
- care of child (other household) – personal care/accompanying
- care of adult (other household) – personal care
- care of adult (other household) – accompanying
- helping relatives, friends, neighbours, acquaintances;

McKeating Actuarial Services, Inc.

www.mckeating-actuarial.com

4. Time spent on **shopping for, buying, and selling goods and services** equals the sum of the times spent on

- shopping or buying goods
- shopping for services
- researching for goods and services
- selling goods or services (0.2% of the total time in this category).

The **other care** category would include activities such as the care of an elderly parent (living in the same household or elsewhere) and the after-school care of a grandchild (living in a different household).

We grouped all other activities into the categories **paid work, education, transport, personal care, media and communications** and **other free time**. We then verified that the total time spent on all categories of activities equaled 24 hours for all respondents. As the focus of the analysis was on lost valuable services, only the first four categories detailed above are considered in the tables that follow.

CLASSIFICATION VARIABLES

A number of variables in the data file have been used to classify respondents in order to tabulate average times spent on various activities for a variety of groupings of individuals. These include the following:

Province of Residence – we grouped the provinces as follows to reduce sampling variability:

- **Atlantic provinces** – 3,582 respondents resided in New Brunswick, Nova Scotia, Prince Edward Island, or Newfoundland & Labrador
- **Quebec** – 3,472 respondents resided in Quebec
- **Ontario** – 5,013 respondents resided in Ontario
- **Prairie provinces** – 3,338 respondents resided in Manitoba, Saskatchewan, or Alberta
- **British Columbia** – 1,985 respondents resided in British Columbia

Age Group – respondents were grouped in decennial age groupings as follows:

- **15 to 24 years** – 1,303 respondents
- **25 to 34 years** – 2,127 respondents
- **35 to 44 years** – 2,597 respondents
- **45 to 54 years** – 2,789 respondents
- **55 to 64 years** – 3,741 respondents
- **65 to 74 years** – 2,958 respondents
- **75 years and over** – 1,875 respondents

McKeating Actuarial Services, Inc.

www.mckeating-actuarial.com

Sex

- Male – 7,739 respondents
- Female – 9,651 respondents

Living Arrangement – the following living arrangements are included in the tables (note that the categories are not mutually exclusive):

- **With partner** – 9,525 respondents had a spouse/partner living in the household
- **No partner** – 7,865 respondents did not have a spouse/partner living in the household
- **With parents** – 1,412 respondents were living with both parents, living with mother only, or living with father only

Main Activity – the following main activities are included in the tables (based on the data file variable “main activity – last week”):

- **Employed** – 8,471 respondents indicated they were working at a paid job or business
- **Student** – 774 respondents indicated they were going to school
- **Keeping house** – 1,207 respondents indicated their main activity was household work/caring for child
- **Retired** – 4,985 respondents indicated they were retired

Children in the Household

- **No children** – 12,727 respondents indicated that they did not have any of their children living in the household
- **Youngest < 5** – 1,328 respondents indicated that their youngest child living in the household was under 5 years old
- **Youngest 5+** – 3,333 respondents indicated that their youngest child living in the household was age 5 or older

USING THE TABLES

As explained earlier, we have presented estimates of the average time spent per day on four categories of activities:

- **domestic work**
- **child care**
- **other care**
- **shopping for, buying, and selling goods and services**

McKeating Actuarial Services, Inc.

www.mckeating-actuarial.com

Along with each estimate is an estimated coefficient of variation (CV), expressed as a percentage. The CV quantifies the variability associated with the fact that averages based on a sample will differ from the averages obtained using the entire Canadian population. The CV does not address the person-to-person or day-to-day variability in how much time individuals spend on various activities.

The CV is estimated as:

$$CV (\%) = 100 \times \frac{\text{estimated standard deviation of average time}}{\text{estimated average time}},$$

where the standard deviation is estimated using the bootstrap weights as described earlier.

By presenting the coefficient of variation rather than the standard deviation, the variability is expressed relative to the estimated average. We can interpret the CV using a normal distribution approximation. For example, a CV of 20% means that, if the survey were repeated a large number of times, about 68% of the averages would be within 20% of the “true” population average, and about 95% of the averages would be within $2 \times 20\% = 40\%$ of the population average. Thus, a lower CV would suggest a more reliable estimate.

FINAL COMMENTS AND CAUTIONS

According to the Statistics Canada guidelines for release of estimates, a CV between 16.5% and 33.3% indicates high sampling variability and should be accompanied by a warning. A CV of 33.4% or greater, indicates very high sampling variability and should be used with great caution. Many of the CV estimates in the following tables are in the high to very high range. This should be taken into account when the expert is using the corresponding averages.

In addition, Statistics Canada guidelines state that the number of respondents who contribute to the calculation of an estimate should be at least 15. If not, the estimate generally should not be released. We have complied with this guideline, and no estimates are presented if the number of respondents (right-hand column of each table) is less than 15.

We note that the “other care” category of activities may not be applicable to all injured or deceased individuals.

Finally, population averages would generally only be suitable for situations in which actual time use information for the injured or deceased individual is not available.
